1. The command “pwd” shows you where your current working directory is.

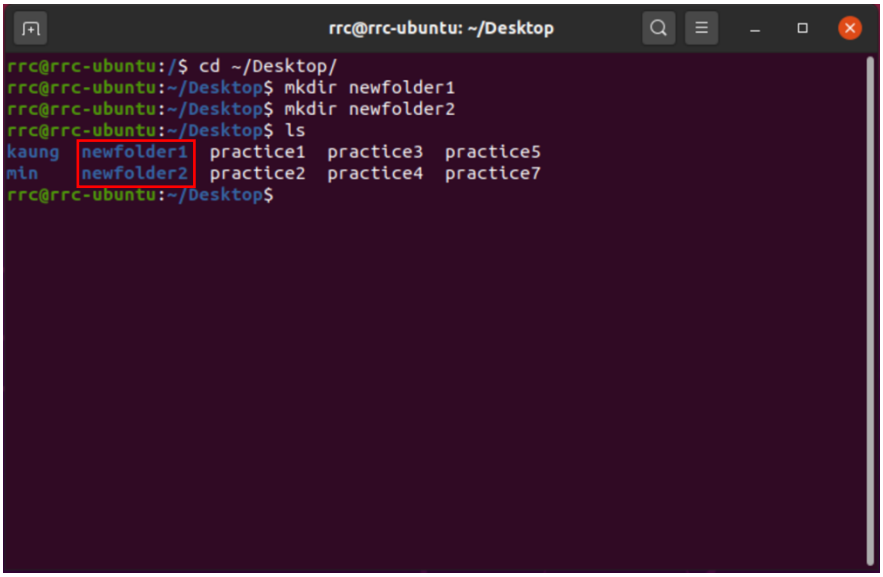

2. The “ls” command will work across all Linux systems in listing what’s inside your current working directory.

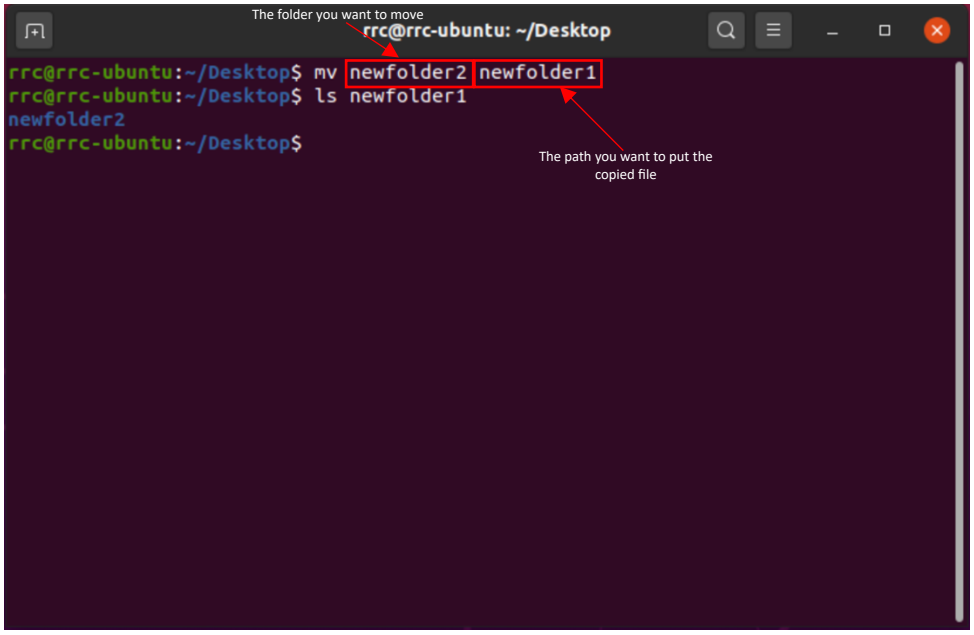

3. You can use the command “cd” to change your current working directory

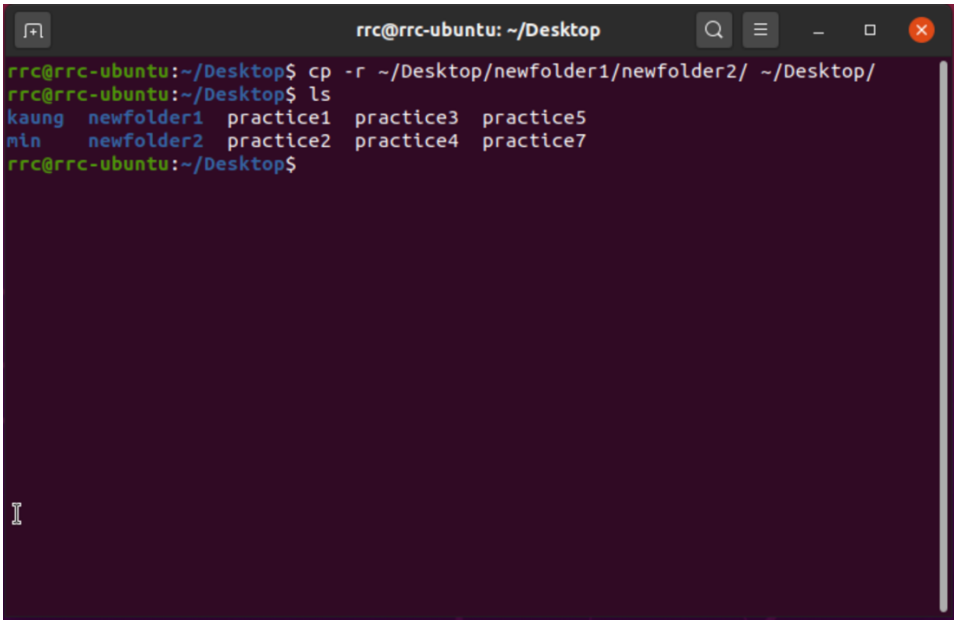

4. You can make new folder using the “mkdir” command.
   This command requires argument, in this case the folder’s name.

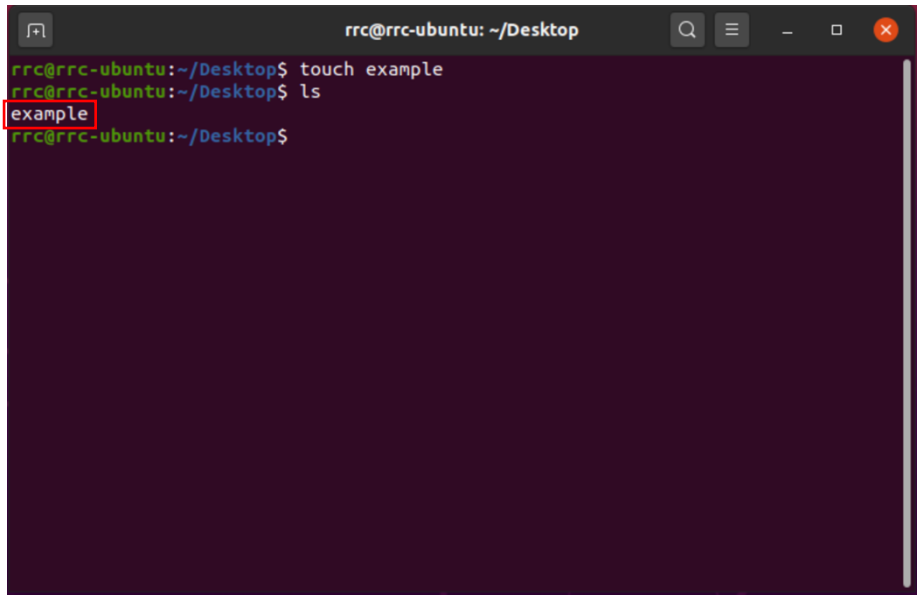

5. You can use folders using the “move” command to move items
   In this case, you will need to provide the arguments which are as below.

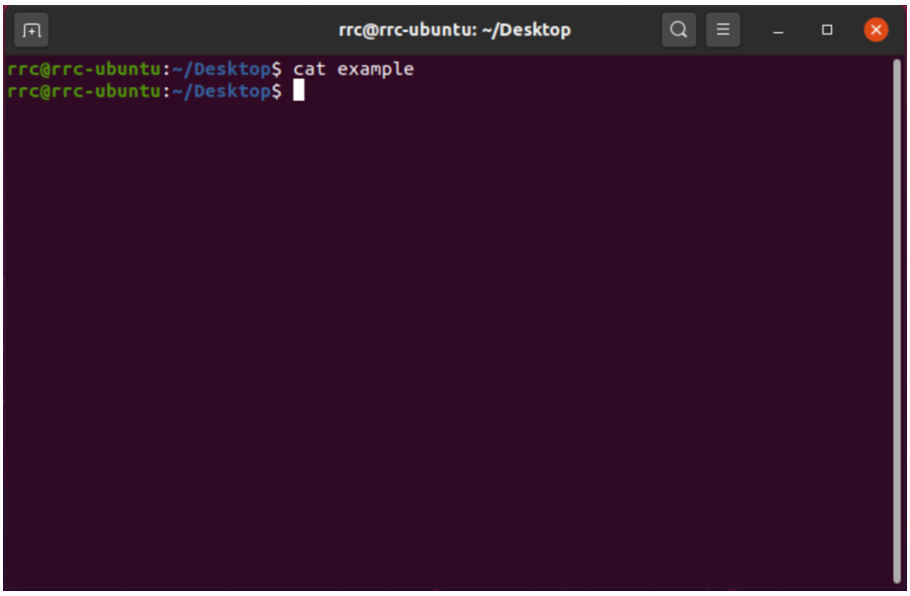

6. You can use the “copy” command to copy files.
   Unlike the above one, you’ll need to provide both the option and the argument to copy a folder.

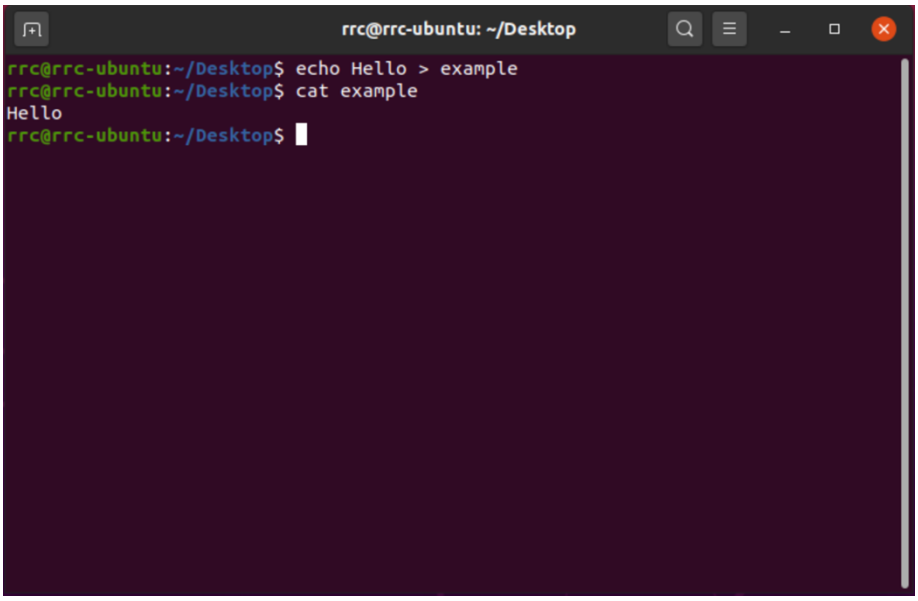

7. You can use the “touch” command to create files.

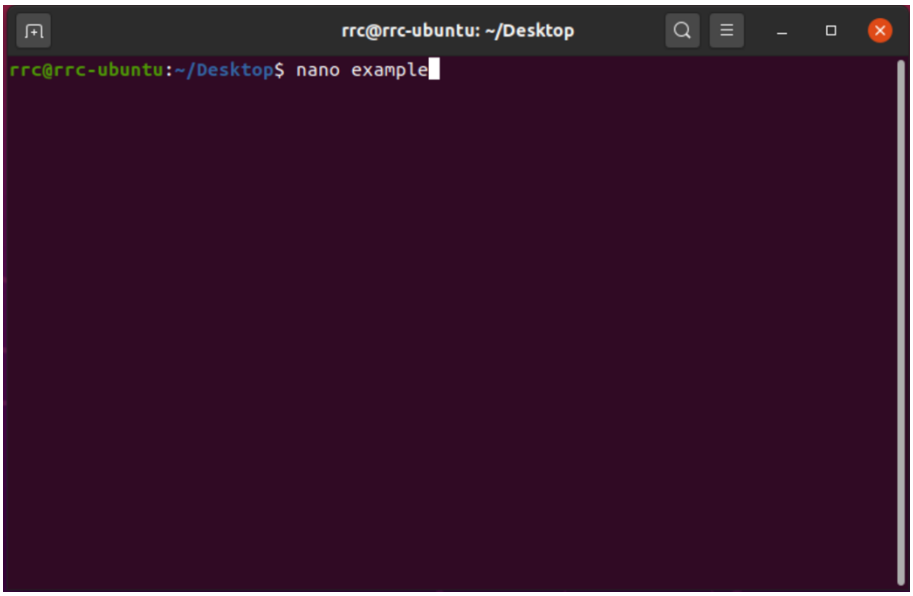

8. To view what's inside a file, you can use the "cat" command. In this case, you cannot see anything since there's nothing inside.

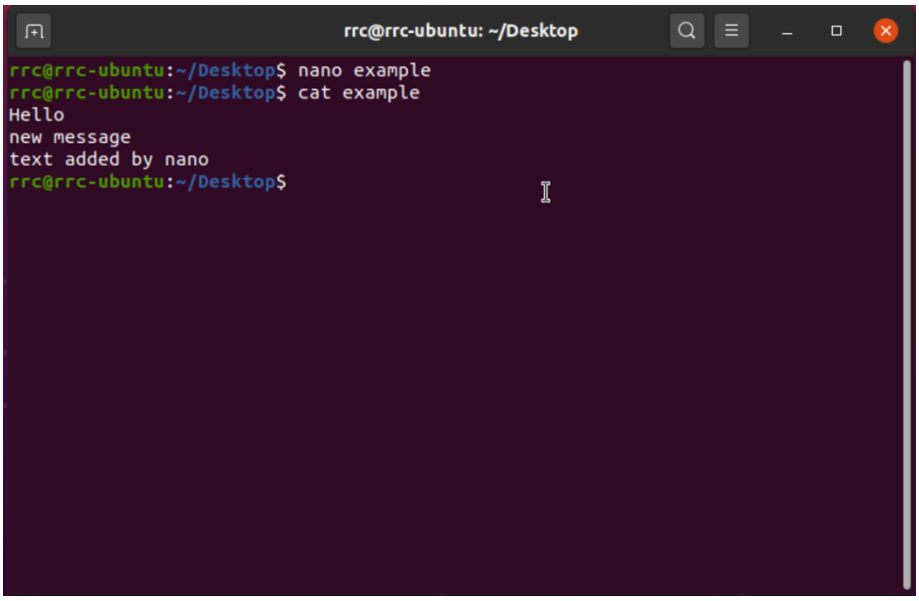

9. You can use the "echo" command to write inside a file. You will need to mention which file you want to write over with an arrow ">"

10. You can use “nano” as a text editor right in the terminal.

11. Use to arrow to navigate around the text and hit Ctrl+X and then Y and then enter.

12. “vi” is another great text editor. Type “vi example” to use it.
    Hit “i” to get to insert mode and you can add text.
    If you’ve done editing, hit esc key to leave insert mode and hit “:wq” to save and quit. If you do not want to save the file, hit “:q!”
