1. Go to https://proxmox.mvcc.edu/ and log in.
2. Start your virtual machine.
3. Open “Terminal” by right-clicking on your desktop OR searching “Terminal” in your apps.

Commands

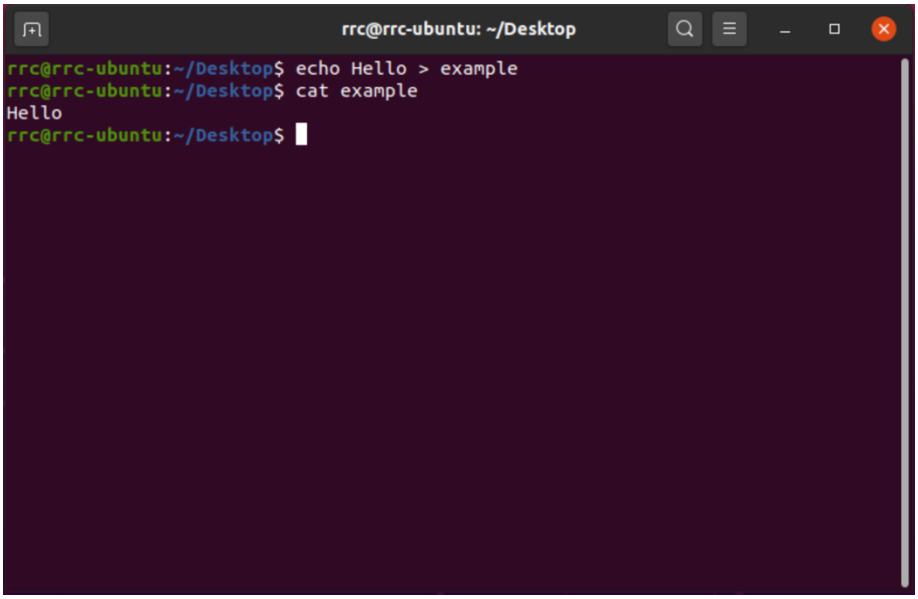

1. You can use the “touch” command to create files.

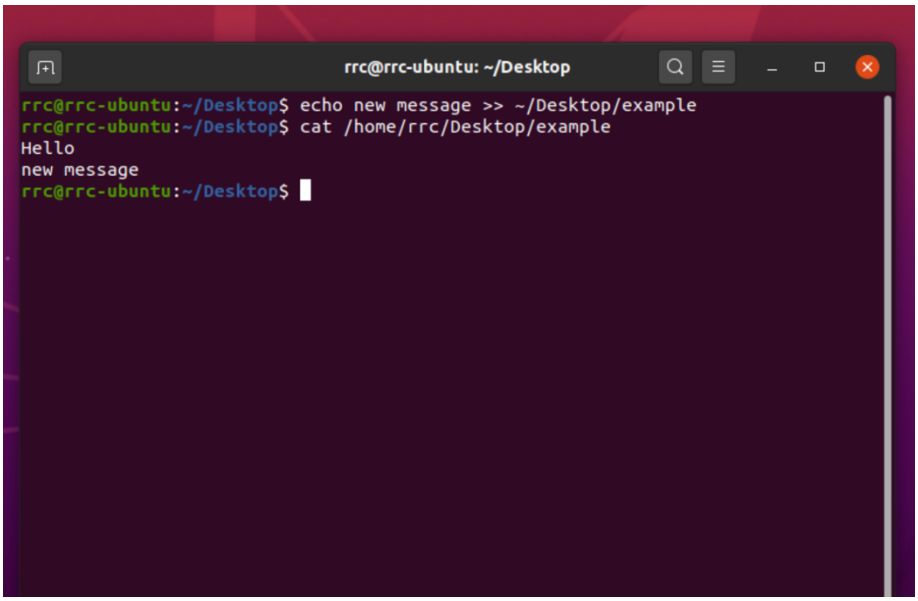

2. To view what’s inside a file, you can use the “cat” command. In this case, you cannot see anything since there’s nothing inside.

3. You can use the “echo” command to write inside a file. You will need to mention which file you want to write over with an arrow “>”

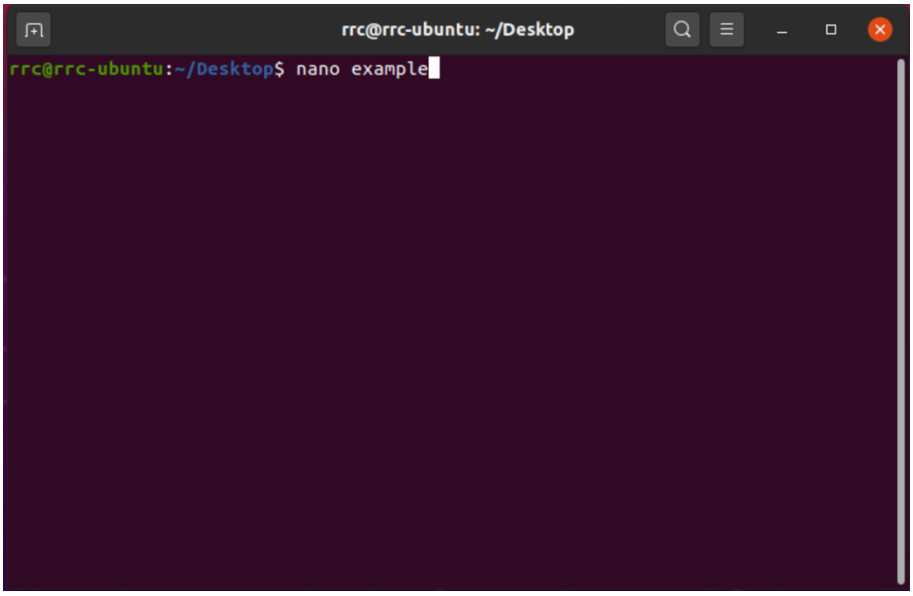

4. If you want to add more to that file, you will need a double arrow “>>”

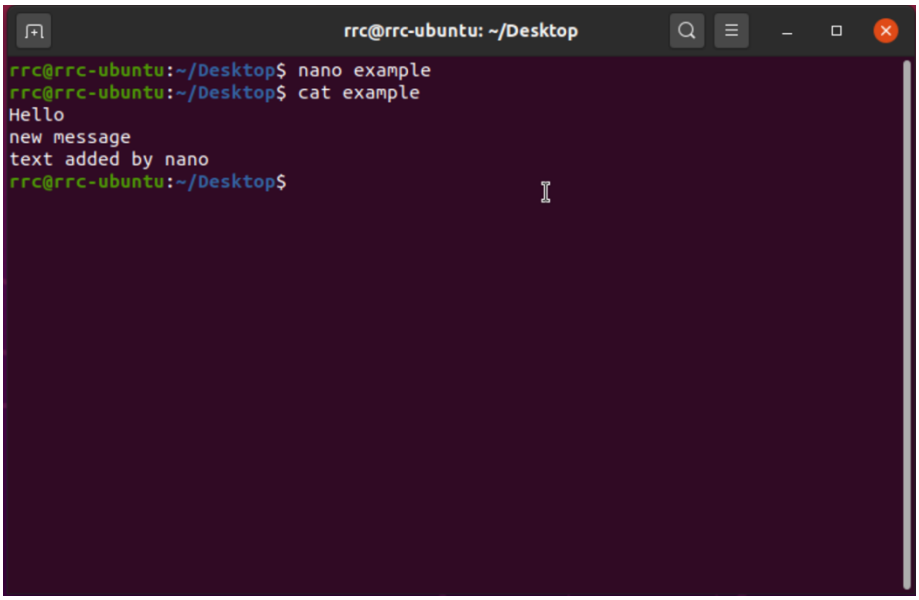

You can also redirect files and folders using “>>”

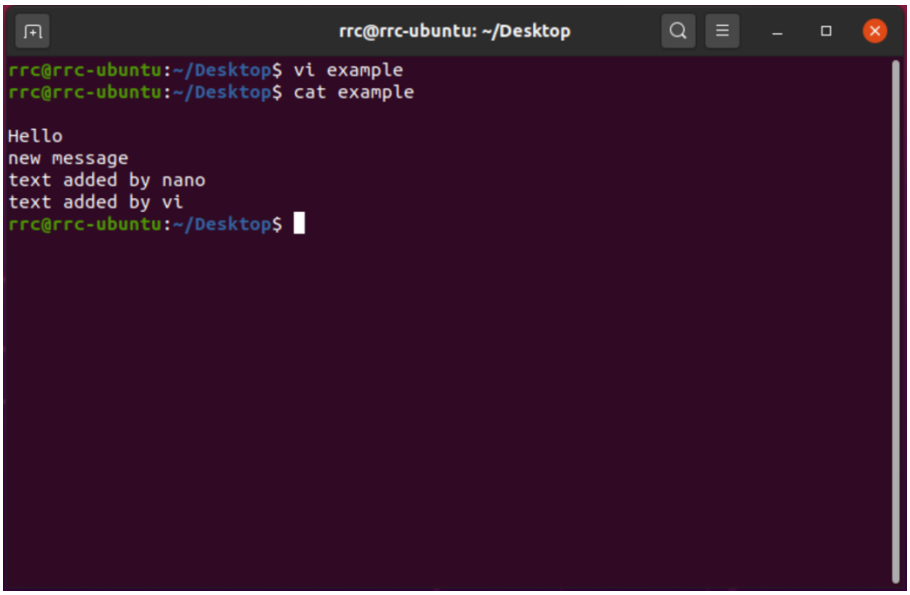

5. You can use “nano” as a text editor right in the terminal.

6. Use to arrow to navigate around the text and hit Ctrl+X and then Y and then enter.

7. “vi” is another great text editor. Type “vi example” to use it.
   Hit “i” to get to insert mode and you can add text.
   If you’ve done editing, hit esc key to leave insert mode and hit “:wq” to save and quit. If you do not want to save the file, hit “:q!”

8. You can also open GUI by typing “gedit”
